Clinical implications of body mass index (BMI) and weight ...
You've probably heard the term BMI (body mass index). It's based on your height and weight, and it's widely used to determine if you're in a healthy weight range.

~~Body Mass Index and Breast Size in Women: Same or ...~~
Body Mass Index and breast cancer 31 May 2016. Research shows that a woman's weight may affect the outcomes of her breast cancer treatment. The Body Mass Index (BMI) is a number that indicates whether someone is underweight, normal, or overweight. In this article, we present the studies that correlate BMI with breast cancer.

~~Body Mass Index and breast cancer—CareAcross~~
Breast cancer risk among postmenopausal women increases with increasing body mass index (BMI) (1, 2). From a recent meta-analysis, it was estimated that there is a 3% increase in risk per

1 kg/m² increase in BMI ().The mechanism for the association between obesity and breast cancer risk is not established, but it may result, at least in part, from an increase in the serum concentration of ...

~~Body Mass Index Associated with Breast Cancer, Regardless ...~~

Body mass index at older ages was not associated with hormone receptor-negative breast cancer risk. In analyses by intrinsic breast cancer subtype (Figure 3), the nonluminal (ER-negative and PR-negative) subtype was inversely associated with BMI at ages 18 to 24 (HR, 0.86; 95% CI, 0.77-0.96) and 45 to 54 years (HR, 0.90; 95% CI, 0.84-0.98), but not with BMI at ages 25 to 34 and 35 to 44 years.

Body mass index (BMI) has been linked to breast cancer risk in conventional population studies. In these studies, high BMI is associated with reduced risk of breast cancer in premenopausal women but with increased risk in postmenopausal women. These changed risks may be caused by BMI or caused by environmental factors that are associated with BMI.

~~Genetically Predicted Body Mass Index and Breast Cancer ...~~

Obesity is a condition in which a person has an unhealthy amount and/or distribution of body fat. To measure obesity, researchers commonly use a scale known as the body mass index (BMI). BMI is calculated by dividing a person's weight (in kilograms) by their height (in meters) squared (commonly expressed as kg/m^2). BMI provides a more accurate measure of obesity than weight alone, and for ...

~~Body Mass Index And Breast~~

Background: Elevated body mass index (BMI) is associated with increased risk of postmenopausal breast cancer. The underlying mechanisms, however, remain elusive. Methods: In a nested case-control study of 621 postmenopausal breast cancer case participants and 621 matched control participants, we measured 617 metabolites in prediagnostic serum.

~~Association of Body Mass Index and Age With Subsequent ...~~

Body mass index (BMI), an inverse predictor of breast density 4, 10, is also hypothesized to impact postmenopausal breast cancer risk through hormonal mechanisms. If hormonal mechanisms are involved, it is plausible that breast density and BMI would be most strongly associated with risk of estrogen receptor-positive (ER+) breast cancer.

~~Body mass index, mammographic density, and breast cancer ...~~

Introduction. Substantial evidence suggests that obese women have poorer survival after a breast cancer diagnosis compared to normal-weight women [1-8]. However, the degree of obesity associated with reduced survival and the relationship of obesity with breast cancer recurrence remains unclear [4, 6, 9, 10]. Furthermore, reports suggest that the association of body mass index (BMI) with breast ...

~~Why BMI (Body Mass Index) Doesn't Tell the Whole Story~~

Many breast imaging centers provide this service at a reasonable cost. Your doctor can order this test to assess your bone health — and your body composition can be checked at the same time. Body mass index (BMI) is a reliable indicator of total body fat for both men and women.

~~Body mass index and breast cancer: analysis of a nation ...~~

Methods: We performed a retrospective analysis of 1017 breast cancer patients treated in our hospital from January 2004 to December 2012. Three groups were divided according to body mass index (BMI) when breast cancer diagnosis: normal weight, BMI < 25.0 kg/m; overweight, $25.0 \leq \text{BMI} < 30.0$ kg/m; and obesity, $\text{BMI} \geq 30.0$ kg/m.
