Canine Parvovirus: Current Perspective

Abstract. Objective: To review and summarize current information regarding epidemiology, risk factors, and pathophysiology associated with canine parvoviral infection, and to outline diagnostic and treatment modalities for this disease. Preventative and vaccination strategies will also be discussed, as serologic documentation of immunocompetence and adoption of safe and effective vaccination ...

Canine Parvovirus | Cornell University College of ...

Canine parvovirus is a highly contagious virus that can affect all dogs, but unvaccinated dogs and puppies younger than four months old are the most at risk. Dogs that are ill from canine parvovirus infection are often said to have "parvo." The virus affects dogs' gastrointestinal tracts and is ...

Canine parvovirus | American Veterinary Medical Association

Canine parvovirus (CPV) is the most dreadful enteropathogen causative of fatal disease in puppies and adult dogs worldwide (Decaro and Buonavoglia, 2012). CPV is a non-enveloped, single-stranded DNA virus that has been recently included in the same viral species, Carnivore protoparvovirus 1, along with feline panleukopenia virus (FPLV) and ...

Molecular Epidemiology of Canine Parvovirus, Europe ...

Canine parvovirus type 2 (CPV-2) emerged in late 1970s causing severe epizootics in kennels and dog shelters worldwide. Soon after its emergence, CPV-2 underwent genetic evolution giving rise consecutively to two antigenic variants, CPV-2a and CPV-2b that replaced progressively the original type.

Canine Parvovirus Type 2 | IntechOpen

Canine parvovirus type 2 is responsible for acute gastroenteritis in dogs, often fatal in 6-12-week-old puppies. In fact, despite vaccination, it is still widespread in the canine population and, if pups are not vaccinated or when maternal antibodies interfere with their vaccination, they generally become naturally infected [3].

Molecular epidemiology of canine parvovirus in Morocco ...

Canine parvovirus (CPV) and canine enteric coronavirus (CECoV) are often cited as causes of diarrhoea in dogs. This study aimed

Acces PDF Canine Parvovirus Epidemiology In Bulgaria Sage Pub

to determine the prevalence of CPV and CECoV in dogs presenting with severe diarrhoea to PDSA PetAid hospitals throughout the UK. A total of 355 samples were collected from the PDSA between 2006 and 2008. All samples were tested for CPV using a long range PCR and for ...

(PDF) Epidemiology, Pathogenesis, Diagnosis and Treatment ... Canine parvovirus 2 (CPV-2) has been considered to be an important pathogen of domestic and wild canids and has spread worldwide since its emergence in 1978. It has been reported from Asia, Australia, New Zealand, the Americas and Europe. Two distinct parvoviruses are now known to infect dogs—the ...

Canine Parvovirus Epidemiology in Bulgaria

Abstract. Canine parvovirus 2 (CPV-2) emerged in 1978 as one of the most pathogenic etiologic agents in dogs. Under the influence of evolution, the original CPV-2 was replaced, a few years later, by 2 variants, CPV-2a and CPV-2b.

Canine Parvovirus - an overview | ScienceDirect Topics

Canine parvovirus (CPV) is a highly contagious viral disease of dogs that commonly causes acute gastrointestinal illness in puppies. The disease most often strikes in pups between six and 20 weeks old, but older animals are sometimes also affected. A rare variant of the disease may be seen in very young (neonatal) puppies is myocarditis (an inflammation of the heart muscle).

Canine parvoviral enteritis: a review of diagnosis ...

Canine parvovirus 2 is distinct genetically from a previously described parvovirus of dogs, minute virus of canines, which is now called canine parvovirus 1. Since its emergence in the 1970s, continuing genetic variation has resulted in the appearance of novel strains of canine parvovirus 2, with three major variants (2a, 2b, and 2c) having now ...

(PDF) Canine Parvovirus Epidemiology in Bulgaria

Canine parvovirus 2 (CPV-2), the causative agent of one of the most severe diseases in dogs, was first identified in 1978 after an epizootic of gastroenteritis and myocarditis, and is now occurring worldwide. 17 The investigation of the evolutionary

changes suggested that CPV-2 has originated from a feline panleukopenia-like virus infecting wild carnivores.

Epidemiology of canine parvovirus and coronavirus in dogs ...
Canine parvovirus (CPV) enteritis is characterized by intestinal hemorrhage with severe bloody diarrhea. The causative agent, CPV-2, was first identified in the late 1970s. CPV is a nonenveloped, linear, single-stranded DNA virus with a genome of approximately 5 kb, and it belongs to the genus Parvovirus, together with feline panleukopenia virus, mink enteritis virus, raccoon parvovirus ...

Canine parvovirus epidemiology in Bulgaria - CORE
Canine parvovirus (CPV), which causes hemorrhagic enteritis in dogs, has 3 antigenic variants: types 2a, 2b, and 2c. Molecular method assessment of the distribution of the CPV variants in Europe showed that the new variant CPV-2c is widespread in Europe and that the viruses are distributed in different countries.
