~~CONSTITUTIVE MODELING OF ENGINEERING MATERIALS—THEORY—~~

6.2 Restrictions on constitutive equations . You may be called upon to develop a stress-strain law for a new material at some point of your career. If so, it is essential to make sure that the stress-strain law satisfies two conditions: (i) It must obey the laws of thermodynamics.

A new elastic/viscoplastic constitutive model for compaction of power materials has been proposed. The model can be determined from a few conventional compression triaxial tests. In this model the irreversible volumetric strain is taken as work-hardening parameter. The model prediction matches reasonably well the experimental data.

The microplane model, conceived in 1984, is a material constitutive model for progressive softening damage. Its advantage over the classical tensorial constitutive models is that it can capture the oriented nature of damage such as tensile cracking, slip, friction, and compression splitting, as well as the orientation of fiber reinforcement:Another advantage is that the anisotropy of materials ...

ENGINEERING MATERIALS AND CONSTITUTIVE MODELING In this chapter we give a brief introduction to the particular field within applied solid me-chanics that deals with the establishment of constitutive models for engineering materials. Some generally accepted constraints that must be imposed on constitutive models are dis-cussed.

The first constitutive equation (constitutive law) was developed by Robert Hooke and is known as Hooke's law. It deals with the case of linear elastic materials. Following this discovery, this type of equation, often called a "stress-strain relation" in this example, but also called a "constitutive assumption" or an "equation of state" was ...

Finite element models of radial keratotomy using the different best-fit constitutive laws were then compared. The results suggest that the nonlinearity in the response of the cornea is material rather than geometric, and that material nonlinearity is important for modeling refractive surgery.

The constitutive equations for a particular material, together with the conservation laws of mass, linear momentum, angular momentum, and energy, govern the response of that material. Unlike the conservation laws, however, the constitutive equations vary from material to material.
