### What is Network Architecture? - CCM

A content delivery network, or content distribution network (CDN), is a geographically distributed network of proxy servers and their data centers.The goal is to provide high availability and performance by distributing the service spatially relative to end users.CDNs came into existence in the late 1990s as a means for alleviating the performance bottlenecks of the Internet, even as the ...

### Content delivery network - Wikipedia

Each packet transmitted and received over a network contains binary data (ones and zeros that encode the contents of each message). Most protocols add a small header at the beginning of each packet to store information about the message's sender and its intended destination.Some protocols also add a footer at the end.Each network protocol can to identify messages of its own kind and process ...

Types of Networking Protocols. Below are the different types of networking protocols which are as follows: 1. IPv6. Refers to Internet Protocol version 6, is the future addressing format, as soon we can see the IPv4 addresses getting exhausted with a rising number of machines and the public IPs being structured up will go into version 6.

### What is Networking Protocols | How Networking Protocol works?

The network you have at home uses the same networking technologies, protocols and services that are used in large corporate networks and on the Internet. The only real difference between an home network and a large corporate network is the size. A home network will have between 1 and 20 devices and a corporate network will have many thousands.

### Basic Networking Concepts-Beginners Guide

What is Network Architecture First and foremost, what is network architecture? It's basically the physical and logical design which refers to the software, hardware, protocols and the media of transmission of data. Simply put, it refers to how computers are organized and how tasks are allocated among these computers.
