A system is any process that produces an output signal in response to an input signal. This is illustrated by the block diagram in Fig. 5-1. Continuous systems input and output continuous signals, such as in analog electronics. Discrete systems input and output discrete signals, such as computer programs that manipulate the values stored in arrays.

Lecture 2: Signals and systems: part I

More seriously, signals are functions of time (continuous-time signals) or sequences in time (discrete-time signals) that presumably represent quantities of interest. Systems are operators that accept a given signal (the input signal) and produce a new signal (the output signal). Of course, this is an abstraction of the processing of a signal.

Discrete-time Signals and Systems - MIT OpenCourseWare

Signals and Systems: Part I In this lecture, we consider a number of basic signals that will be important building blocks later in the course. Specifically, we discuss both continuous-time and discrete-time sinusoidal signals as well as real and complex expo-nentials. Sinusoidal signals for both continuous time and discrete time will be-

H.S. Chen Chapter1: Classification of signals and systems 10 • The above three properties are not true for a discrete-time signal  $x[n]=e^{j\Omega_0 n}$ . 1. For a discrete-time signal, we have  $x[n]=e^{j(\Omega_0+2\pi)n} = e^{j\Omega_0 n} \times e^{j2\pi n} = e^{j\omega_0 n}$  i.e., the signal  $x[n]$  at frequency  $(\Omega_0 + 2\pi)$  is the same as that at frequency  $\Omega_0$ , that is unlike the continuous case:  $e^{j\omega_1 t} = e^{j\omega_2 t}$  if  $\omega_1 = \omega_2$

## Continuous Signals and Systems with MATLAB (Electrical ...

Continuous-time signals and systems never take a break. When a circuit is wired up, a signal is there for the taking, and the system begins working — and doesn't stop. Keep in mind that the term signal is used here loosely; any one specific signal may come and go, but a signal is always present [...]

Continuous-Time Signals and Systems - dummies

1.1 Continuous and Discrete Signals and Systems A continuous signal is a mathematical function of an independent variable  $t$ , where  $t$  represents a set of real numbers. It is required that signals are uniquely defined in  $t$  except for a finite number of points. For example, the function  $f(t) = \sqrt{t}$  does not qualify for a signal even for  $t > 0$  since the square root
