Fabien Durola, CNRS—Centre de Recherche Paul Pascal, University of Bordeaux, France, reviews the book Fragments of Fullerenes and Carbon Nanotubes by Marina A. Petrukhina and Lawrence T. Scott.. Every organic chemist was at one time, at least during his early years, convinced that aromatic molecules are by definition absolutely flat, writes Durola.

Fragments of Fullerenes and Carbon Nanotubes brings together international experts in the field to discuss their findings related to all aspects of this fascinating, beautiful and fairly recently discovered form of carbon. Familiarly known as "buckyballs" for their similarity in appearance to the highly symmetrical geodesic domes of Buckminster Fuller (and, also, soccer balls), fullerenes, and the related carbon nanotubes, hold out the tantalizing possibility of offering true ...

by the recognition that fullerenes, the most strikingly curved networks of trigonal carbon atoms, can be formed under high energy conditions in the gas phase (2, 6), we reasoned that it should be possible to capitalize on the principles at work there for a new synthesis of corannulene and related fragments of fullerenes. Toward this end,
