Solution to Problem 1.8. Let p_i be the probability of winning against the opponent played in the i th turn. Then, you will win the tournament if you win against the 2nd player (probability p_2) and also you win against at least one of the two other players [probability $p_1 + (1 - p_1)p_3 = p_1 + p_3 - p_1p_3$]. Thus, the probability of winning the tournament is $p_2(p_1 + p_3 - p_1p_3)$.

If the candidate chooses b (which happens with probability $1/3$), then the quizmaster can only open door c . Hence $P((b;c)) = 1/3$. Similarly, $P((c;b)) = 1/3$. Clearly, $P((b;b)) = P((c;c)) = 0$. 2.14b If the candidate chooses a then she or he wins; hence the corresponding event is $f(a;a);(a;b);(a;c)$, and its probability is $1/3$.

$P(x = c) = 0$ The probability that x takes on any single individual value is zero. The area below the curve, above the x -axis, and between $x = c$ and $x = c$ has no width, and therefore no area (area = 0). Since the probability is equal to the area, the probability is also zero. $P(c < x < d)$ is the same as $P(c \leq x \leq d)$ because probability is equal to area.
