About Nuclear Imaging With the challenge of aging populations around the world and the rising incidence of diseases, solving diagnostic challenges to ensure patients have better outcomes has never been more important.

About Nuclear Medicine & Molecular Imaging - SNMMI

Nuclear Medicine. Molecular Nuclear Medicine (MNM) is a medical specialty that uses trace amounts of active substances, called radiopharmaceuticals, to diagnose, treat and monitor diseases. MNM is non-invasive and provides physicians with critical information that may otherwise be unavailable without surgery or more invasive diagnostic procedures.

In this paper we describe the characteristics of cytokines and chemokines, focussing on their role as radiopharmaceuticals for the imaging of cancer cells in vivo, a new challenge for molecular nuclear medicine.

Most studies use a 2-d challenge first—if the challenge is normal, the test is stopped. In this case, a 2-d 99m Tc-exametazine baseline test was used first, followed by an acetazolamide technique. This procedure was not in accordance with current guidelines of the Society of Nuclear Medicine and Molecular Imaging, but it was supported by a ...

Moreover, labeling the clot is one of the future challenges of nuclear medicine and molecular imaging. More than an alternative to CTPA or V/Q scintigraphy, the objective of this positive imaging of VTE may be a complementary analysis of the clot with a better characterization of its structure and the datation of its processes.

Targeting cytokine/chemokine receptors: a challenge for ...  
Molecular imaging includes the field of nuclear medicine, which uses very small amounts of radioactive materials (radiopharmaceuticals) to diagnose and treat disease. In nuclear medicine imaging, the radiopharmaceuticals are detected by special types of cameras that work with computers to provide very precise pictures of the area of the body being imaged.

The other major challenge for venous thromboembolism diagnosis may be the potential additional value of molecular imaging allowing specific targeting of thrombi in order, for example, to differentiate venous thromboembolism from tumor or septic thrombus, or acute from residual disease.
