This may make it easier to explain how the sedimentary record can be used as a proxy for sea-level change, but does not prepare students for the subtle differences in meaning of terms in the current spectrum of sequence stratigraphic models.

The sedimentary infill reveals a fining upward succession of marine sediments up to 6 m thick, mostly along a regressive sequence. All facies are of Holocene age and started to be laid down when sea level was approximately 3 m below present elevation.

The Sedimentary Record - SEPM

The sedimentary record of historical storm surges obtained differs from the existing records in the Baltic Sea region. In the middle part of the Polish coasts, nearby Mrzeżyno (Fig. 1), at least two major marine inundation events were identified as sandy layers within coastal wetlands by Piotrowski et al. (2017) .
